olivares@uco.es

Abstract— Microprocessors is a typical subject within the Computer Architecture field of scope. It is quite common to use simulators in practical sessions, due to the complexity of its contents. In this paper a new methodology based on practical sessions with real devices and chips is proposed. Simple designs of microprocessors are exposed to the students at the beginning, rising the complexity gradually toward a final design with a multiprocessor integrated in a single FPGA chip. Finally, assessment results are shown.

Keywords: Learning Experiences; Laboratory Experiences; Teaching Engineering; Computer Architecture

I. INTRODUCTION

Traditional laboratory practical sessions to teach microprocessors are based on simulators, in this paper an experience implementing real microprocessors is shown. The main purpose is to encourage the student interest and to improve the assessment. This proposal is useful for many subjects within several engineering degrees. This activity was carried out in particular in the Microprocessors subject, in the degree in Computer Sciences at the University of Córdoba.

In most cases, computer architecture has been taught with software simulators [1], [2]. These simulators are useful to show: internal values in registers, memory accesses, cache fails, etc. However, the structure of the microprocessor is not visible, and students are not aware learning a real processor. Recently [3], [4], digital design is being teaching using real Programmable Logic Devices (PLD), showing its attractiveness for the students. Also recent works shown how the learning through projects and games based on FPGAs are very useful [5].

In this work, a methodology for easy design and real implementation of microprocessors is proposed, in order to provide students with a user-friendly tool. Simple designs of microprocessors are exposed to the students at the beginning, rising the complexity gradually toward a final design with two processors integrated in an FPGA; each of which has an independent memory system, and are intercommunicated with a unidirectional serial channel. Furthermore, an introduction to the architecture of a T1 SUN OpenSparc system with 8 processors, 4 thread/processor plus one MicroBlaze is introduced at the end of the semester while students are working on their projects, this final seminar is useful because students are encouraged when see that a high performance parallel architecture is suitable of being implemented on a single FPGA Virtex5 [6].

In this paper the methodology to design and implement a microprocessor or multiprocessors is presented. To illustrate it with high detail and in a useful way, how to design the most complex practical session is shown. In section I, other methodologies based on simulators are referenced. The software platform used to implement real processors is presented in section II. Features of MicroBlaze processor are introduced in section III. The course practical content is described in section IV. To illustrate how a processor is designed and implemented, section V presents a brief guide of how to build a biprocessor, this is the most complex practical session. Finally, conclusions are presented in section VI.

II. SOFTWARE TOOL

The Xilinx Platform Studio (XPS) is used to design MicroBlaze processors. XPS is a graphical IDE for developing and debugging hardware and software. XPS simplifies the procedure to the users, allowing them to select, interconnect, and configure components of the final system. Dealing with this activity, the student learns to add processors and peripherals, to connect them through buses, to determine the processor memory extension and allocation, to define and connect internal and external ports, and to customize the configuration parameters of the components. Once the hardware platform is built, the students learn many concepts about the software layer, such as: assigning drivers to peripherals, including libraries, selecting the operative system (OS), defining processor and drivers parameters, assigning interruption drivers, establishing OS and libraries parameters.

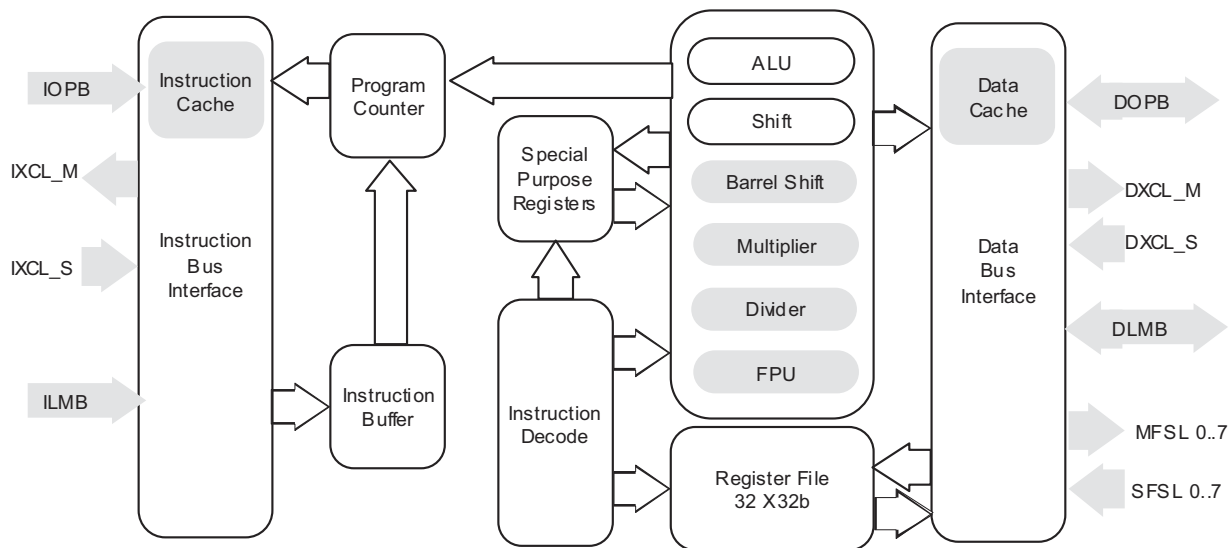

Students have deeper documentation available in [7], [8], and other useful resources recommended are [9], and, [10].

An embedded system performed with XPS can be summarized as a conjunction of a Hardware Platform (HWP) and a Software Platform (SWP), each defined separately.

A. The Hardware Platform

The HWP is described in the Microprocessor Hardware Specification (MHS) file; it contains the description of the system architecture, the memory map and the configuration parameters. HWP can be defined as one or more processors connected to one or more peripherals through one or more buses. The definition of the activity follows this sequence:

- To add processors and peripherals.
- To connect them through buses.

Legend Optional feature. This figure is inspired on MicroBlaze Processor Reference Guide e. Xilinx. 2005

Figure 1. MicroBlaze architecture. In gray, reconfigurable components

- To determine the processor memory allocation.
- To define and connect internal and external ports.
- To customize the configuration parameters of the components.

B. The Software Platform

The SWP is described in the Microprocessor Software Specification (MSS) file; it contains the description of drivers, component libraries, configuration parameters, standard input/output devices, interruption routines and other software features. The sequence of activities needed to define the SWP is the following:

- To assign drivers to peripherals.
- To assign interruption drivers.
- To establish OS and libraries' parameters.

III. THE MICROBLAZE PROCESSOR

MicroBlaze is a 32-bit specific purpose processor developed by Xilinx in VHDL. It can be parameterized using XPS to obtain an *à-la-carte* processor. It is a RISC processor, structured as a Harvard architecture with separated data and instruction interfaces.

MicroBlaze components are divided into two main groups depending on their configurability as shown in Fig.1.

Some fixed feature components are:

- 32 general purpose registers sized 32-bit each.
- Instructions with 32 bits word-sized, with 3 operands and 2 addressing modes.
- 32 bits address bus.

- 3-stage Pipeline.

Some of the most important configurable options are:

- An interface with OPB (On-chip Peripheral Bus) data bus.
- An interface with OPB instruction bus.
- An interface with LMB (Local Memory Bus) data bus.
- An interface with LMB instruction bus.
- Instruction cache.
- To include EDK libraries.
- To select the operative system (OS).
- To define processor and drivers' parameters.
- Data cache.
- 8 Fast Simplex Link (FSL bus) Interfaces.
- CacheLink bus support.
- Hardware exception support.
- Floating Point Unit (FPU).

IV. PRACTICAL DESIGNS

Practical sessions introduce gradual learning, allowing the fast design based on previous sessions. Essential problems in hardware programming will be raised:

- Hyperterminal serial communication.
- Using IO ports.
- Memory controller.
- Interruption routines and priority.

	System Base	IO OPB	SRAM LMB	MBLaze Interrupt.	External Interrupt.	Multiprocessor

S8						■

Figure 2. Sessions and contents.

- Message passing in multiprocessors communication.

The practical content of the subject is composed of 8 projects. In the first session, students make a basic system which will be used in following sessions as the base core system. Second and third sessions are used to introduce the input/output flow and the communication with external peripheral through the On-chip Peripheral Bus, for general purpose. SRAM external memory is added to the system at fourth session. Next session is dedicated to the External Memory Controller and how to split the bus. MicroBlaze interruptions are added in the sixth session, and external interruptions using the interruption controller are included in the seventh session. Finally, students build a biprocessor, using the Fast Simple Link channel at session eight. In fig. 2 the relation between practices is shown. For instance, 5th session is based on all previous sessions, 7th session is based on 3rd and 1st session.

V. BIPROCESSOR SYSTEM DESIGN

The last and most complex practical session is the design and implementation of a biprocessor. A computational system composed of two MicroBlazes will be designed. Both MicroBlazes will be interconnected using message-passing protocol. Each MicroBlaze has its own non-shared memory for instructions and data.

In the Fig. 3 a diagram with the structure of the design is shown. In it, the buses and components used have been detailed. It also includes how they are interconnected

At first, following the logical sequence exposed previously, a HWP will be created. This HWP will include the configuration of the components and buses, their interconnection, the memory map, ports and other parameters.

In the following subsection, the steps needed to configure the system will be described. Trivial stages, such as the creation of the project, will not be included in this paper. The parameters shown in this section depends on the FPGA chip, in this case the Spartan 3 board [11].

Figure 3. Biprocessor system diagram.

A. Hardware Platform Specifications

This stage is described in the MHS file. Following, the components specified in the structure of the system are enumerated:

- Two MicroBlaze processors.
- Two on-chip RAM memory blocks (BRAM), one for each processor.
- One UART.
- One OPB bus, to connect the UART with the slave processor.
- Two LMB buses to communicate each processor with their respective data memory controller; and another two LMB buses to interconnect the processors with their instruction memory controller.
- One FSL channel to intercommunicate each processor with the other.

After that, the interconnection of buses and components is defined. The connection of the memory ports are also set at this point. The student has to specify in the connection matrix which components are linked to which buses and with which kind of connection.

In the exposed case, four LMB buses are needed to access local memory, two for each MicroBlaze, because each processor has its own memory subsystem.

Also, one FSL channel which connects both processors.

Each BRAM has been designed with 4 different ports. Each MicroBlaze reaches its memory block through two different interfaces (instructions and data).

After that, it is necessary to map the components inside the configuration memory of the processors. XPS provides a functionality which is able to compute automatically a valid configuration memory map for a monoprocessor system structure. However, as the system proposed is a biprocessor one, this functionality cannot be used.

Each MicroBlaze looks for the first instruction in its program at memory address 0x0.

The next step is to define the internal and external ports. Most of the internal ones are configured by XPS with default settings. It is also necessary to define and to connect some of the internal ports to make the system works: those ports related to the reset and clock signals must be forwarded to all of the subsystems and components. Four external ports are mandatory: clock, reset, UART in and UART out. With these

ports, the student sends commands and synchronization information to the system. Finally, the components are configured. The parameters for each component and their meaning are described thoroughly in the documentation included in the XPS platform.

Particularly, MicroBlaze includes a parameter which selects the amount of FSL interfaces used. Thus, both processors have to set this configuration value to one to allow the communication between them. The configuration of this parameter is done by changing `C_FSL_LINKS`. This parameter has to be set to a numerical value, representing the amount of FSL interfaces to be included in the core.

Another interesting configuration to be mentioned is the UART operational configuration. The student has to determine the operational frequency, the application of the parity bit checking, working bauds, etc. A valid set of parameters for the UART and MicroBlaze are the following:

1) *UART parameters.*

a) `C_CLK_FREQ = 50 000 000`. Set the frequency of the OPB bus, connected to the UART. It has to coincide with the operational system speed.

b) `C_BAUDRATE = 19200`. Set the bauds for the UART. The terminal used to receive characters has to be configured at the same baud rate.

c) `C_USE_PARITY = 0`. Set whether the UART should work with parity bit or not.

2) *MicroBlaze parameters.*

a) `C_FSL_LINKS = 1`. In order to communicate between the two processors, at least, one FSL channel has to be defined.

After the HWP is defined, the netlist files and the support files can be generated.

B. *Constraints File*

The constraints file specifies how external ports from the designed system correspond with the Spartan-3 Board [] pins:

```
# Clock signal.
Net sys_clk LOC=T9;
Net sys_clk TNM_NET = sys_clk;
TIMESPEC TS_sys_clk = PERIOD
sys_clk 20000 ps;
# Reset button
Net sys_reset LOC=l14;
Net sys_reset TIG;
# UART
NET TX LOC = R13;
NET RX LOC = T13;
```

Once the constraint file and the HWP are ready, XPS has enough information to create the internal bitstream file.

C. *Software Platform Specification*

The SWP corresponds with the Microprocessor Software Specification (MSS). The first step is to select the drivers for

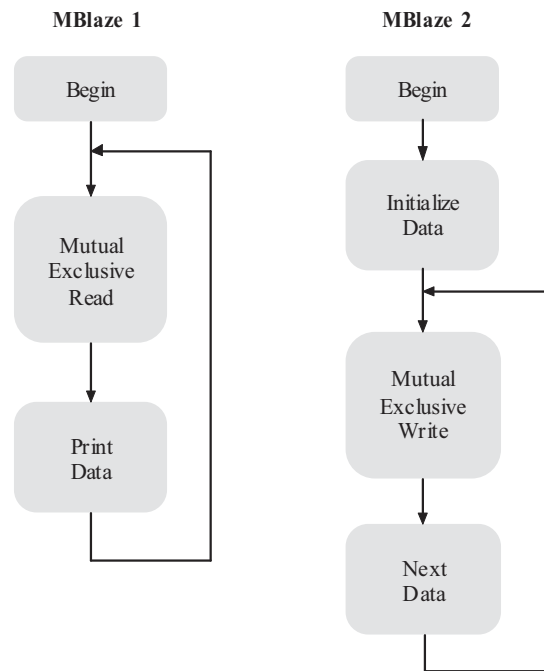

Figure 4. Software application flowchart.

the components, the SWP libraries and the OS for each processor. In this project, the standalone OS is selected, no libraries are used and the drivers for the components are established by default.

In the following step, the configurable parameters from processors and drivers must be edited; also the interruption routines must be assigned if needed; for instance, in the system under explanation, the interruption routines are not used. In this case, all fields are configured by default except for the processors, which must be configured to work at 100 MHz.

In the final step, the OS libraries configuration parameters are edited and configured. The standalone OS has a minimum size software layer with some primitives for input/output, control, memory allocation, etc.

In the proposed system, the student must specify the UART as the input/output standard peripheral. This is established by assigning the UART to the OPB master MicroBlaze.

Once SWP is configured, it is possible to program the processors software code. However, it is necessary to generate previously the libraries and the Board Support Package (BSP).

D. *Software Application*

To carry out the goals of this work it is necessary to create two SW projects, one for each MicroBlaze. With these, each Microblaze will execute its own program.

Some primitives are used to allow a fluid message passing between both processors through the FSL channel.

The writer processor generates the data that will be sent to the reader processor through the FSL channel using mutual exclusion primitives for message passing. The OPB bus master sends the data received by the reader processor to the UART.

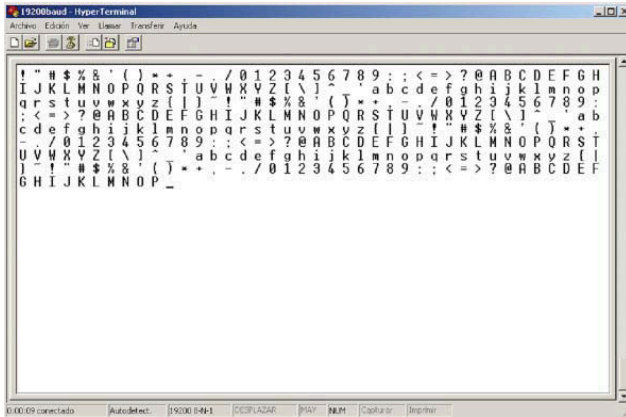

Figure 5. Hyperterminal capture while the both processors are

After the compilation of the software application, the FPGA configuration file is generated.

Finally, the configuration file is loaded into the FPGA. After all these steps, the students execute the global system and they verify that both processors work properly: The reader processor reads data generated from the writer processor, and the writer processor generates successive data. This process is shown in Fig. 4.

Following the code based on C language for both MicroBlaze processors is shown. Some Xilinx libraries are required to optimize the code and to use some resources:

MicroBlaze 1 Code. Reading data from MicroBlaze 2 and showing them in the UART

```
#include <mb_interface.h>
int main( )
{
    int i;
    while(1) {
        microblaze_bread_datafsl(i,0);
        xil_printf("%c ",i); }
    return;
}
```

MicroBlaze 2 Code. Generating consecutive ascii characters and sending them to MicroBlaze 1 through FSL

```
#include <mb_interface.h>
int main()
{
    int i = 33;
    int c;
    while(1) {
        for(c=0;c<10000000;c++);
        for(c=0;c<10000000;c++);
        icroblaze_bwrite_datafsl(i,0);
        i++;
        if(i>126) i=33; }
    return;
}
```

Hyperterminal screen was captured and is shown in Fig. 5 to show the results when the both processors are running.

VI. CONCLUSIONS

XPS can be used as an excellent tool for the students to design and build complex architectures avoiding implementation details. Otherwise, they would spend a lot of time until they master concepts and techniques to develop those systems. Students understand the functionality and the structure of the different components, in order to interconnect all of them to build either a monoprocessor or a biprocessor.

A notable improvement of the qualifications compared to the average of the previous five years was obtained. In particular, in 2008 an improvement of 21% was obtained in front of the mean of the assessment for 2005-07 period. In 2009 the improvement in the assessment was 22%.

As a result of a survey, students are more motivated using real devices than using just simulators.

Furthermore, the configuration of each of the component parameters contributes to a better understanding of the developed architecture. And they are able to test how different values for those parameters influence the performance of the whole system. Finally, a guide on how to implement several processors systems on a single FPGA chip has been provided.

ACKNOWLEDGMENT

Authors wish to remark the great task carried out by the Xilinx University Program, XUP; and the Sun Microsystems OpenSPARC University Program, which have donated software and materials which have been very useful to partially finance this work.

Contributions Index

“ <i>e-Adventure</i> ” - Introducing Educational Games in the Learning Process	1121
A competitive collaborative learning experience in chemical plant design	1711
A computational introduction to STEM studies	663
A Concept Map Approach for Introduction to Computer Engineering Course Curriculum	243
A context for programming learning based on research communities	1317
A Knowledge based analytical model of propaedeutic cycles for Higher Education in Colombia: Linking Media Education to Higher Education in Colombia.	281
A Learning Approach Based on Robotics in Computer Science and Computer Engineering	1343
A Middleware for the Integration of Third-party Learning Tools in SOA-based Learning Management Systems	869
A New Competencies Assessment Data Model	473
A new Systemic Methodology for Lab Learning based on a Cooperative Learning Project	317
A Practical Electronic Instrumentation Course for Engineering Students	1181
A Project-Based Learning Approach to Teaching Power Electronics	717
A Project-Oriented Integral Curriculum on Electronics for Telecommunication Engineers	105
A Proposal for the Evaluation of Final Year Projects in a Competence-based Learning Framework	929
A Remote Laboratory to Promote the Interaction between University and Secondary Education	345
A review of electronic engineering design free software tools	1869
A simulation software for sequential control	553
A Student-Centered Collaborative Learning Environment for Developing Communication Skills in Engineering Education	783
A Study and a Proposal of a Collaborative and Competitive Learning Methodology	1011
A system to manage the allocation of MSc Dissertations at University of Minho	159
A Systems Theory Perspective of Electronics in Engineering Education	1829
A Tablet PC-Based Teaching Approach using Conceptual Maps	671
A technological platform for teaching control engineering	1147
A Tool to Reveal the Students Work Activity Along an Academic Period	1283
A Virtual Photovoltaic Power Systems Laboratory	1739
A web-based e-learning tool for UML class diagrams	973
Achieving and Sustaining Gender Balance in an Undergraduate Teaching Institution	845

Action Research: A Way to Generate New Approaches to Teaching Mathematics in Bioengineering	1385
Active Learning in Power Electronics	1451
Active Learning in Telecommunication Engineering: A case study	1557
Adaptation in a PoEML-based E-learning Platform	1683
Adapting the Telecommunication Engineering curriculum to the EEES: a project based learning tied to several subjects	1307
Adaptive Ecology M-Learning for National Park Based on Scaffolding Theory	575
Adaptive hypermedia systems for e-learning	1801
Adjunct Enterprise Professors in the European Higher Education Area	77
Aligning Assessment with Learning Outcomes in Outcome-based Education	1239
An adaptive Multi-Agent based Architecture for Engineering Education	217
An application-case for derivative learning: optimization in colour image filtering	539
An approach for Description of Open Educational Resources based on semantic technologies	1111
An enterprise e-learning solution: The UNED practical case in the EHEA	611
An Experience in Cooperative Learning Developing a Real Aerospace Project	1225
An Experience of a Multidisciplinary Activity in a Biomedical Engineering Master Degree	321
An integrated system as a tool for complex technology learning	755
An Interdisciplinary Practical Course on the Application of Grid Computing	943
An Undergraduate Microwave and RF Low-Profile Laboratory	329
Analysis of the results of four years of research and application of a student-centered system based on the ECTS to first-year students in order to improve their performance in the subject AC-I	237
Analyzing self-reflection by Computer Science students to identify bad study habits	263
Applying a methodology for collaborative assesment in learning groups	1205
Applying an Inductive Method to a New, Multidiciplinary, Management of Innovation & Technology Course: Evidence from the University of Nicosia	1807
Approach to Teaching Communications Systems by Collaborative Learning. Student Perceptions in the application of Problem-Based Learning.	1295
Assessing Assessment Formats: The Current Picture	1233
Assessing Competency in Undergraduate Software Engineering Teams	271
Assessment of learning activities in discussion forums online	487
Assessment of the learning competence of mathematics for first-years of the Computer Science degree	231
Attracting Student Vocations into Engineering Careers. EnginyCAT: Catalonia Promotional and Prospective Plan	1761
Attracting, Retaining, and Preparing a Diverse Academic Engineering Workforce	1843

Authoring Environment for E-learning Production Based on Independent XML Formats	415
Authoring Learning Contents, Assessments and Outcomes in an Integrated Way	303
Automatic Guidance Tools for Enhancing the Educative Experience in Non-Immersive Virtual Worlds Preliminary results from project V-LeaF	1131
Bringing the everyday life into engineering education	1433
Business and Management Competency of Engineers: Curriculum and Assessment	295
Challenges in an Emerging Country: A Digital Divide Case Using Robotics	1521
Challenging Students' Responsibility: An Engagement Methodology	253
Collaborative Subjects for Embedded Systems Learning in the EHEA Frame: A Practical Approach	1255
Competence certification as a driver for professional development: A IT-related exploratory case-study	81
Competencies for Informatics Systems and Modeling. Results of Qualitative Content Analysis of Expert Interviews	513
Competency-Based Pedagogical Wrapping	65
Computation for Science and Engineering	991
Consequences of the Declining Interest in Engineering Studies in Europe	71
Continuous Proactivity in Learning Management Systems	199
Cooperative assessment in the hands on skills of computer networks subjects	1273
Cooperative Learning vs. Project Based Learning: a practical case	1575
Cooperative work and continuous assessment in an Electronic Systems laboratory course in a Telecommunication Engineering degree	395
Course design approaches for the EHEA. Scaling up from pilots.	1923
Current Issues With Assessment Formats and Interoperability	1247
Cybertech: Robotic Competition and Subject	465
Database Teaching tools	1883
Deep Drawing Tool for E-learning	1859
Delivering authentic experiences for engineering students and professionals through e-labs	1085
Deployment of Remote Experiments: The OnPreX course at the TU Berlin	1065
Design lab work in telecom	1853
Design of an Educational Oscilloscope	1875
Design of an Introductory Networking subject in advance of the European Higher Education Area: Challenges, experiences and open issues	1453
Developing an Optical Spectrum Analyzer	313
Developing and Evaluating a Game-Based Project Management Learning Platform	1391
Developing Global Teamwork Skills: The Runestone Project	1051
Development of a mobile learning framework for analog electronics course	561

Development of a Small Radio Telescope at the Technical University of Cartagena	1197
Development of a Wiimote-based gesture recognizer in a microprocessor laboratory course	451
Development of the OCW Consortium	1659
Developping of Low Cost Capacitive Sensors for Laboratory Classes	445
Didactic videos about basic concepts on alternating current circuits	1941
Directions in Quality	
Distance Practices in Subjects of Automatic Control	967
Distributed Collaborative Homeworks: Learning Activity Management and Technology Support	1587
Dual Instructional Support Materials for introductory object-oriented programming: classes vs. objects	1931
Dynamic Virtual Environment for multiple Physics Experiments in Higher Education	731
Easily Integrable platform for the deployment of a remote laboratory for microcontrollers	327
Educational Computer Tool for Visualizing and Understanding the Interaction of Electromagnetic Waves with Metamaterials	543
Educational Research in Spain: A review through the Education Awards of CESEI - IEEE	99
Educational Software Interface for Power Electronic Applications	1165
Educational visualizations of syntax error recovery	1019
Educative use of simulators in free software for the education of the physics in the engineering programs	621
Efectiveness of a Peer Mentoring Program in Engineering Education	1395
Embedding Sustainability in Capstone Engineering Design Projects	1603
Encouraging Interaction and Status Awareness in Undergraduate Software Engineering Projects	179
Engaging Weaker Programmers in Problem Solving	997
Engineering Education in the Developing World: Complexity and Sustainability	1047
Engineering in Latin America: A view at the Higher Education Level	1039
Engineering societies as a vehicle tool for engineering students.	631
Engineers and their practice: a case study	531
enginy@eps: Motivating the Engineering Courses	653
Enhance Learning System by using Real-time Internet Classroom and Web-based Collaborative Works	1533
Enhancing Authoring, Modelling and Collaboration in E-learning environments: UNED research outline in the context of E-Madrid excellence network	1137
Enhancing Database Querying Skills by Choosing a More Appropriate Interface	1899
Ensure Program Quality: Assessment A Necessity	1623

ESA Hands-on Space Education Project Activities for University Students: Attracting and Training the Next Generation of Space Engineers	1701
Evolutionary algorithms for subgroup discovery applied to e-learning data	983
Evolutionary Mechanism for E-Learning Platforms - A new approach for old methods	891
Experiences in using a MUVE for enhancing motivation in engineering education	775
Experiences in Using Integrated Multimedia Streaming Services to Support E- Learning in Manufacturing Processes	1773
Experiments in evaluation: towards an eXtreme Learning method	761
Federated authentication and authorization for reusable learning objects	1071
Filling the gap of Information Security Management inside ITIL®: proposals for postgraduate students	907
Fingerprint Identification in LMS and its Empirical Analysis of Engineer Students' Views	1731
FPGA/Embedded system Training Kit Targeted to graduate Courses towards Industry level short training	1159
Game-based learning in technology management education	191
GE3D: a virtual campus for a technology-enhanced learning	725
Generalization of an Active Electronic Notebook for Teaching Multiple Programming Languages	1081
GILABVIR: Virtual Laboratories and Remote Laboratories in Engineering.	1403
Hands-on intelligent mobile robot laboratory with support from the industry	457
Hardware Implementation of Remote Laboratory for Digital Electronics	357
Higher Education Process Management Model, Educative Programs Improvement in Software Quality	1957
How can Apache help to teach and learn automatic control?	1541
Illustrating amazing effects of optics with the computer	549
Impact of Learning Experiences Using LEGO Mindstorms® in Engineering Courses	503
Implantation of a Methodology based on Standard Supplements applied in Engineering Education	1813
Implementation of a virtual communications laboratory for e-Learning	1425
Implementation of An Engineering Educator Graduation Program for the formation of New Skilled Engineering Teachers	647
Implementing new learning methodologies in the Hard Sciences: a cross curricular study of students' and professors acceptance	1835
Indexing and Searching Learning Objects in a Peer-to-Peer Network	1667
Influence of Libre Software in Education The blogs planet case	1127
Influence of PBL Practical Classes in Microcontroller-Based Digital Systems Learning	1779
Information Technology in Logistics: Teaching Experiences, Infrastructure and Technologies	1721

Innovative Learning and Teaching Methodology in Electronic Technology Area. A Case Study in Computer Science University Degrees	1217
Innovative Practices for Learning Human-Computer Interaction by Engineering Learners	1041
Integrating digital video resources in teaching e-learning engineering courses	1791
Integrating People and Technology By Design: Design-First Instruction for Introductory Students in Information Technology	1461
Integrating Teams In Multidisciplinary Project Based Learning in Mechanical Engineering	709
Integrating the Design Thinking into the UCD's methodology	1479
Integration View of Web Labs and Learning Management Systems	1409
Intelligent evaluation in educational context	401
Internet-based Performance-centered Learning Environment for Curriculum Support (IPLECS) and its application in mLearning	819
Interoperable Content for Performance in a Competency-driven Society: Results from the iCoper project	
Introducing alternative assessment into engineering language education at the Madrid Technical University	1649
Introducing multidisciplinary thinking in Computer Engineering - A new way of teaching database systems	523
Introducing Project Management Theory into a Capstone Design Sequence	1715
Introducing Scenario Based Learning: Experiences from an undergraduate electronic and electrical engineering course.	953
Introduction to Electronics as a Minor Subject	375
Knowledge Management and organizational learning University-Company - Learn to Learn-	1289
Knowledge Management and Professional Profiles in Electronic Systems Engineering	365
Knowledge, skills, and competences -- Descriptors for Engineering Education	639
Lab2go - A Repository to Locate Educational Online Laboratories	1743
Learning by doing in Project Management: Acquiring skills through a collaborative model	701
Learning Dynamics and Control in a Virtual World	737
Learning engineering by teaching engineering in the European Higher Education Area	1455
Learning network protocols through WSN based games	937
LMS and Web 2.0 Tools for e-Learning: University of Deusto's Experience.Taking Advantage of Both	1753
M2Learn: Towards a homogeneous vision of advanced mobile learning development	569
Madar learning : learning envirnment for E&M learning	1693
Management and Optimal Distribution of Large Student Numbers	1893

Meaningful learning checking of concepts related to equations and functions in Physics Chemistry according to the main theme gas laws.	407
Measuring collaboration and creativity skills through rubrics	1513
Mechatronics E-course for regular students and adults: realization and comparison of efficiency	959
Meta-analysis of the TAEE project applying social network analysis	129
Methods of the quality assurance applied at remote laboratory selection	1641
Mixed e-Assessment: an application of the student-generated questions technique	769
M-learning tools on distance education	677
Model of Virtual Laboratory	1951
MotionLab	1501
Motivating Younger Students by Using Engineering Graduation Projects to Facilitate their Work	1153
Nano-World A Showcase Suite for Technology-Enhanced Learning	1075
Natural Sciences in the Information Society - First Experiences	825
NETLAB: Online Laboratory Management System	1341
New Directions in Engineering Accreditation	1921
OCW Consortium: learning through the worldwide sharing and use of free, open, high-quality education materials organized as courses	1657
OER's production cycle with social authorship and semantic tools	121
On Education Quality Control Issues for Sino-France Hybrid Engineer Diploma	481
On Freshman Training of Engineering Students by Projects and DIY Activities	225
Online assessment of practical knowledge in electronics laboratory	751
Open educational resources (OER) inspire teachers and motivate students	435
Open Source Learning Management Systems in E-Learning and Moodle	593
Paper-Based versus Computer-Based Testing in Engineering Education	1633
Personal Learning Environments in a Global Higher Engineering Education Web 2.0 realm	897
Personalized Construction of Self-Evaluation Tests	863
Platform for teaching of location technologies based on Zigbee Wireless Sensor Networks by learning-through-play theory	1299
Portugol IDE v3.x	1007
Practical Framework of Employability Skills for Engineering Graduate in Malaysia	921
Practice and Research in Engineering Education: Activities of the CESEI Technical Committee	1173
Principles for the Design of a Remote Laboratory	879
Project-Based Collaborative Learning of Electrical Master Students	1613
Public Displays and Mobile Devices in an Augmented Objects Framework for Ubiquitous Learning	1673

Ranking Learner Collaboration according to their Interactions	797
Real Projects to involve undergraduate students in CS degrees	833
Reconfigurable weblabs based on the IEEE1451 Std.	1359
Reflections about Teaching Engineering Graphics: Knowledge and Competencies Management	1509
Research-based approach application for electrical engineering education of bachelor program students in Riga Technical University	695
Retaining and Retraining: An Innovative Approach to Educating Engineers in a Changing Economy	1551
Retaining electronic engineering students by project- and team-work from the first semester.	1327
Reviews and Findings on Implementing Active Learning in a Large Class Environment	1565
Role of Faculty in Promoting Lifelong Learning: Characterizing Classroom Environments	381
Role of regional consortia in OCWC: OCW-Universia	
Scientific project management course introduction in doctoral studies in Riga Technical University	369
SecondLab: A Remote Laboratory under Second Life	351
Simulations in Undergraduate Electrodynamics	1091
SOA-based Architecture for a Generic and Flexible E-assessment System	493
Social Media Enhanced Studying and Learning in Higher Education	137
Some Research Questions and Results of UC3M in the E-Madrid Excellence Network	1101
SPIRIT - A Life-Cycle Based Gender Mainstreaming Concept at the University of Stuttgart	853
State-of-the-art simulation systems for information security education, training and awareness	1909
Student Internship Placements. Improving the quality of engineering internship programs.	91
Student Motivation and Cross-curricula Development through e-learning applied to cooperation	913
SUBA – An innovative pedagogical experience	173
Supporting Person-Centered Learning: Does the Choice of the Learning Management System Matter?	885
Supporting the Delivery of Learning Contents with Laboratory Activities in SAKAI	165
Teaching Digital and Analog Modulation to Undergraduate Information Technology Students Using Matlab and Simulink	685
Teaching Microprocessors Design Using FPGAs	1189
Team Teaching for Web Enhanced Control Systems Education of Undergraduate Students	1527
Technical congress proceedings as a reusable digital objects educational source	423

Technological Development, Sustainability: Discussions about International Aspects of Engineering Education	1057
Telefónica University Chairs Network	1752
The developing of personal and professional skills in automotive engineers through university competitions	1493
The development of professional mentoring for engineers undertaking a workbased learning Masters degree	389
The influence of design problem complexity on the attainment of design skills and student perceptions	287
The LULA Project by the Telefónica Chair of the University of Extremadura - LULA Linux Distribution for Latin American Universities	1765
The Montegancedo Astronomical Observatory. The first free remote observatory for learning astronomy	1367
The New Degree in Materials Engineering at the Technical University of Madrid (UPM)	807
The Role of Superior Education Institutions on Post-Secondary (Non Superior) Education	1277
The use of agents to represent learners in role-play training	185
The Use of Role Playing in Engineering Curricula: a Case Study in Human-Automation Systems	1335
Three Online Neutron Beam Experiments Based on the iLab Shared Architecture	145
TICTAC: Information and Communication Technologies for Augmentative Communication Boards	1785
Tokyo Tech Graduate Program Allied with Thailand: TAIST (Thailand Advance Institute of Science and Technology) - Tokyo Tech	1031
Tools for Collaborative Development of Visual Models and Languages	1597
Towards the loose coupling between LMS and Remote Laboratories in Online Engineering Education	1937
Toy Design Experience: Improving Student's Motivation and Results in a Final Year Subject	1483
Training Microsystems Technologies in an European eLearning Environment	113
Trends of Use of Technology in Engineering Education	787
Use of Advanced Technologies in a RF and Microwave Engineering Course	811
Use of E-Learning functionalities: results of a survey along Spain	1441
VenDASys – a versatile experimentation platform	205
Virtual analog and digital communications laboratory: LAVICAD	429
Virtual flute: electronic device that uses virtual reality to teach how to play a flute	211
Virtual University as a Role Playing Game	743
VirtuaLab, a Teaching/Learning System for 8 and 32 bits Microcontrollers	1419
Web 2.0 contents for connecting learners in online Learning Network	1211
WEB Instruments	585

Web-based Time Schedule System for Multiple LMSs on the SSO/Portal Environment	153
Who enrolls in electrical engineering? A quantitative analysis of U.S.A. student trajectories	839
WikiDIS: a case of collaborative content management system for educative community	601
Wireless4x4: an integrating learning experience for Telecommunications students	1265
Workshop on VISIR electrical and electronic remote lab: Practical view	1797
Workshop on VISIR electrical and electronic remote lab: Principles and educational view	1663
yPBL methodology: a problem-based learning method applied to Software Engineering	1819
